HOSPITAL COURSE

Lucas, a 61-year-old female with a known history of Type 2 Diabetes and Hypertension, presented to the Emergency Department on May 17, 2025 via ambulance with a 2-hour history of severe substernal chest pain radiating to the left arm, diaphoresis, and nausea. Initial ECG demonstrated ST-segment elevation in leads V1–V4 consistent with anterior STEMI. Troponin-I on arrival was critically elevated at 22.3 ng/mL. The patient was taken emergently to the cardiac catheterization laboratory where coronary angiography revealed 93% occlusion of the left anterior descending (LAD) artery. Successful percutaneous coronary intervention (PCI) was performed with deployment of a drug-eluting stent (Xience Skypoint 3.0 x 28mm). Post-procedural TIMI flow was grade 3. The patient was transferred to the Cardiac Care Unit (CCU) for monitoring. Serial echocardiography on day 2 showed an ejection fraction of 54%, mild anterior wall hypokinesis. Mild acute kidney injury (Creatinine 1.4 mg/dL) was noted, attributed to contrast nephropathy; this resolved with IV hydration by day 4. Blood glucose remained elevated throughout admission and endocrinology was consulted to optimize insulin regimen. The patient remained hemodynamically stable throughout and was discharged on day 10 in stable condition with close outpatient follow-up arranged.
