CLINICAL INTERPRETATION / COMMENTS

Findings are consistent with microcytic hypochromic anemia, likely secondary to iron deficiency; correlation with serum iron studies (ferritin, TIBC) is recommended. Mildly elevated fasting glucose warrants an HbA1c to evaluate for pre-diabetes. TSH elevation with low-normal FT4 is suggestive of subclinical/clinical hypothyroidism; clinical follow-up and repeat thyroid panel in 4–6 weeks is advised. Albumin is mildly low — nutritional status assessment recommended.
